1 Differentiable Manifolds
1.1 Definition

1.1.1 Coordinate Charts

Definition 1.1 (Coordinate Charts).

An m-dimensional, $m \neq \infty$ coordinate chart on a topological space $\mathcal{M}$ is a pair

$$(U, \phi) \begin{cases} U \subseteq \mathcal{M}, U \text{ open} \\ \phi : U \to \mathbb{R}^m, \phi \text{ homeomorphism} \end{cases}$$

Remark.

If $U = \mathcal{M}$, then we say the coordinate chart ϕ is globally defined; if not, then it is locally defined. Few manifolds have globally defined property. ♍
Remark.

The basic method of studying manifolds is to analyze it in the familiar Euclidean space via coordinate charts. ♍

1

Definition 1.2 (Overlap Function).
Let $(U_1, \phi_1), (U_2, \phi_2)$ be a pair of m-dimensional coordinate charts with $U_1 \cap U_2 \neq \varnothing$. Then the overlap function is defined as

$$\phi_2 \circ \phi_1^{-1} : \phi_1(U_1 \cap U_2) \subseteq \mathbb{R}^m \to \phi_2(U_1 \cap U_2) \subseteq \mathbb{R}^m.$$

Definition 1.3 (Atlas).
An m-dimensional atlas on $\mathcal{M}$ is a family of m-dimensional coordinate charts $(U_i, \phi_i), i \in I$ s.t.

1. $\mathcal{M} = \bigcup_{i \in I} U_i$.

2. Each overlap function $\phi_j \circ \phi_i^{-1}, i, j \in I$ is C^∞.

Definition 1.4 (Differentiable Manifolds).
An m-dimensional differentiable manifold is a topological space $\mathcal{M}$ equipped with an atlas.

↗ **Remark.**
We didn't define a differentiable manifold by regulating the differentiability of the coordinate charts themselves. That's because differentiation is not defined on a manifold, so we need to rely on Euclidean spaces. ℳ

1.2 Dimension of a Manifold

> ↗ **Remark.**
>
> Consider a manifold that consists of a rod attached to a disk. The dimension is not same everywhere. We give a criterion on how to describe such a scenario.
>
> ♏

Theorem 1.1 (Invariance of Domain)**.**
For all $A, B \subseteq S^n$, if $\exists\ f : A \to B$ homeomorphic and $B \in \tau_{S^n}$, then $A \in \tau_{S^n}$ too.

> ↗ **Remark.**
>
> Theorem 1.1 is an early theorem in algebraic topology.   ♏

Corollary 1.1.1 (Dimension is Well-defined)**.**
Given $U \in \tau_{\mathbb{R}^n}, U' \in \tau_{\mathbb{R}^{n'}}$, and if $\exists\ f : U \to U'$ homeomorphic, then $n = n'$.

Proof. If $n = n'$, it is trivially true.

If $n < n'$, embed $\mathbb{R}^n$ to $\mathbb{R}^{n'}$ by $f : \vec{x} \mapsto (\vec{x}, \vec{0})$. Via stereographic projection, we can map homeomorphically

$$\phi : U \mapsto V \subseteq S^{n'},$$
$$\phi' : U' \mapsto V' \subseteq S^{n'}.$$

Since the compositions are also homeomorphic, we see V and V' are homeomorphic. However, V' is not an open subset of $\mathbb{R}^{n'}$ because of the 0's, contradicting Theorem 1.1. ※   ▨

> ↗ **Remark.**
>
> Since the definition of a differentiable manifold requires every overlap function to be diffeomorphic, if $U \cap U' \neq \varnothing$, their dimensions must be equal via the above corollary. We can bypass this by demanding $U \cap U' = \varnothing$, as in the rod and disk case.   ♏

> **Corollary 1.1.2.**
> If $g : V \to \mathbb{R}^n$ is a continuous injection and $V \in \tau_{\mathbb{R}^n}$, then $g(V)$ is homeomorphic to V, and $g(V) \in \tau_{\mathbb{R}^n}$.

Proof. On $g(V)$, g is surjective and therefore a homeomorphism. Use stereographic projection and the result is obvious. ▨

1.3 Coordinate Functions

> **Definition 1.5** (Coordinate Functions).
> The coordinate functions are the (Euclidean) components of coordinate.
>
> $$\phi : U \to \mathbb{R}^m \qquad\qquad p \mapsto \phi(p),$$
>
> $$\phi^\mu : U \to \mathbb{R} \qquad\qquad \text{s.t. } \phi(p) = \begin{pmatrix} \phi^1(p) \\ \vdots \\ \phi^m(p) \end{pmatrix}.$$
>
> An alternative notation is
> $$x^\mu := \phi^\mu.$$

> ⤴ **Remark.**
> There are (Euclidean) projection functions,
>
> $$u^\mu : \mathbb{R}^m \to \mathbb{R}.$$
>
> But I think mention it will cause a lot of confusion. Just remember in the future when we say $\frac{\partial}{\partial u^\mu}$, we are referring to the Euclidean partial derivative wrt the μ-th component. ♍

1.4 Manifold With Boundary

1.4.1 Generalized Coordinate Charts

Definition 1.6 (Generalized Coordinate Charts).
A generalized coordinate chart allows chart that

$$\phi : U \to \phi(U) \subseteq (-\infty, 0] \times \mathbb{R}^{n-1},$$

U is open, and ϕ is homeomorphic.

↗ **Remark.**
Essentially, this allows a chart to map to "half planes". In this case, even if a set $\phi(U)$ contains $\{0\} \times \mathbb{R}^{n-1}$ and therefore not open in the Euclidean topology of $\mathbb{R}^n$, it is still considered open in the product topology of $(-\infty, 0] \times \mathbb{R}^{n-1}$. ♏

Definition 1.7 (Manifold With Boundary).
A manifold with boundary is a manifold whose atlas consists of generalized coordinate charts.

Definition 1.8 (Boundary Points of a Manifold).
For all $p \in \mathcal{M}$ is a boundary point of a manifold with boundary $\mathcal{M}$ if $\exists \phi_\alpha \in \Phi$ atlas s.t. $\phi_\alpha^1(p) = 0$.

   The set of all boundary points of $\mathcal{M}$ is denoted $\partial \mathcal{M}$.

1.4.2 Boundary is Well-defined

↗ **Remark.**
A natural question regarding Definition 1.8 is that, the definition only asks for existence, but it does not guarantee the existence of

$$\exists \; \phi_\alpha, \phi_\beta \text{ s.t. } \phi_\alpha^1(p) = 0, \phi_\beta^1(p) \neq 0.$$

We resolve this in the following. ♍

Theorem 1.2.

Suppose U, U' are open sets in the product topology $(-\infty, 0] \times \mathbb{R}^{n-1}$, and $\exists \, f : U \to U'$ homeomorphic. Then

$$f(U \cap (\{0\} \times \mathbb{R}^{n-1})) = U' \cap (\{0\} \times \mathbb{R}^{n-1}).$$

Proof. We show instead that

$$f(U \cap ((-\infty, 0) \times \mathbb{R}^{n-1})) = U' \cap ((-\infty, 0) \times \mathbb{R}^{n-1}).$$

Via Corollary 1.1.2, we see $f(U \cap ((-\infty, 0) \times \mathbb{R}^{n-1}))$ must be an open set in the Euclidean topology of $\mathbb{R}^n$. Therefore, it cannot contain $\{0\} \times \mathbb{R}^{n-1}$. ▨

Corollary 1.2.1 (Boundary is Well-defined).

$\forall p \in \mathcal{M}$, if $\exists \, \phi_\alpha^1(p) = 0$, then $\forall \phi \in \Phi$ atlas, $\phi^1(p) = 0$.

Proof. Make use of the fact that $\phi \circ \phi_\alpha^{-1}$ is a homeomorphism. ▨

2 Tangent Spaces

2.1 The Curve Formulation of Tangent Spaces

> ↗ **Remark.**
> The definition of manifold do not require the entity to be embeded in a higher dimensional space. Therefore, the traditional view of tangency is not valid here.
>
> ♍

> ↗ **Remark.**
> The curve formulation remains valid in the infinite-dimensional case, while the algebraic formulation is not. However, in the finite-dimensional case, they are isomorphic.
>
> ♍

2.1.1 Curves and Vectors

Definition 2.1 (Curve).
A curve on $\mathcal{M}$ is a C^∞ map,

$$\sigma : (-\epsilon, \epsilon) \to \mathcal{M}.$$

Definition 2.2 (Curve Tangency).
Two curves σ_1, σ_2 are tangent at $p \in \mathcal{M}$ if

1. $\sigma_1(0) = \sigma_2(0) = p$.

2. $\frac{d}{dt}(x^i \circ \sigma_1(t))\big|_{t=0} = \frac{d}{dt}(x^i \circ \sigma_2(t))\big|_{t=0}$, $1 \leq i \leq m$.

Written more compactly,

$$\frac{d}{dt}(\phi \circ \sigma_1)\Big|_{t=0} = \frac{d}{dt}(\phi \circ \sigma_2)\Big|_{t=0}$$

♏

Definition 2.3 (Tangent Vectors).
A tangent vector at $p \in \mathcal{M}$ is an equivalence class of curves where the equivalence relation is that they are tangent. It will be denoted as

$$v = [\sigma].$$

Definition 2.4 (Tangent Space).
The tangent space $T_p\mathcal{M}$ at point p is the set of all tangent vectors at point p.

Definition 2.5 (Tangent Bundle).
The tangent bundle $T\mathcal{M}$ is

$$T\mathcal{M} := \bigcup_{p \in \mathcal{M}} T_p\mathcal{M}.$$

2.1.2 Addition and Scalar Multiplication

Definition 2.6 (Addition and Scalar Multiplication).
Let $v_1 = [\sigma_1], v_2 = [\sigma_2] \in T_p\mathcal{M}$, and $r \in \mathbb{R}$. Then define

$$v_1 + v_2 := [\phi^{-1} \circ (\phi \circ \sigma_1 + \phi \circ \sigma_2)],$$
$$rv_1 := [\phi^{-1} \circ (r\phi \circ \sigma_1)].$$

> **Theorem 2.1.**
>
> The definition Definition 2.6 is well-defined. That is, they are independent of the choice of chart (U, ϕ) and σ_1, σ_2 as long as $v_1 = [\sigma_1]$ and $v_2 = [\sigma_2]$.
>
> Therefore, $T_p\mathcal{M}$ is a real vector space.

Proof. Let $v_1 = [\sigma_1] = v_1' := [\tau_1], v_2 = [\sigma_2] = v_2' := [\tau_2]$. First check (1) of Definition 2.2,

$$
\begin{aligned}
(rv_1 + v_2)(0) &= (\phi^{-1} \circ (r\phi \circ \sigma_1(0) + \phi \circ \sigma_2(0))) \\
&= (\phi^{-1} \circ (r\phi \circ \tau_1(0) + \phi \circ \tau_2(0))) \\
&= (rv_1' + v_2')(0),
\end{aligned}
$$

since $\phi \circ \sigma_1(0) = \phi \circ \tau_1(0) = \phi(p)$ by equivalence, and the same for σ_2.

Now consider

$$
\begin{aligned}
\frac{d}{dt}(\phi \circ (rv_1 + v_2))\Big|_{t=0} &= \frac{d}{dt}(r\phi \circ \sigma_1 + \phi \circ \sigma_2)\Big|_{t=0} \\
&= r\frac{d}{dt}(\phi \circ \sigma_1)\Big|_{t=0} + \frac{d}{dt}(\phi \circ \sigma_2)\Big|_{t=0} \\
&= r\frac{d}{dt}(\phi \circ \tau_1)\Big|_{t=0} + \frac{d}{dt}(\phi \circ \tau_2)\Big|_{t=0} \\
&= \frac{d}{dt}(\phi \circ (rv_1' + v_2'))\Big|_{t=0},
\end{aligned}
$$

since $\frac{d}{dt}(\phi \circ \sigma_1)\big|_{t=0} = \frac{d}{dt}(\phi \circ \tau_1)\big|_{t=0}$ by equivalence, and the same for σ_2. ▨

2.1.3 Curves and Derivation

> **Definition 2.7** (Directional Derivative)**.**
> For any $f : \mathcal{M} \to \mathbb{R}$ s.t. $f \in C^\infty$, we define
>
> $$
> v(f) := \frac{d}{dt}(f \circ \sigma(t))\Big|_{t=0},
> $$
>
> where $v = [\sigma]$.

> **Theorem 2.2.**
>
> The definition Definition 2.7 is well-defined. That is, $v(f)$ is independent of the curve σ chosen as well as $v = [\sigma]$.

9

Proof. Let $v_1 = [\sigma_1] = [\sigma_2] = v_2$. Then

$$v_1(f) = \frac{d}{dt}(f \circ \sigma_1)\Big|_{t=0},$$

$$v_2(f) = \frac{d}{dt}(f \circ \sigma_2)\Big|_{t=0},$$

$$\frac{d}{dt}(\phi \circ \sigma_1)\Big|_{t=0} = \frac{d}{dt}(\phi \circ \sigma_2)\Big|_{t=0}.$$

Then

$$v_1(f) = \frac{d}{dt}\Big((\underbrace{f \circ \phi^{-1}}_{\mathbb{R} \leftarrow \mathbb{R}^m}) \circ (\underbrace{\phi \circ \sigma_1}_{\mathbb{R}^m \leftarrow \mathbb{R}})\Big)\Big|_{t=0}$$

$$= (f \circ \phi^{-1})' \circ (\phi \circ \sigma_1) \cdot (\phi \circ \sigma_1)'\big|_{t=0}$$

$$= (f \circ \phi^{-1})' \circ (\phi \circ \sigma_2) \cdot (\phi \circ \sigma_2)'\big|_{t=0}$$

$$= v_2(f),$$

since $\phi \circ \sigma_1(0) = \phi \circ \sigma_2(0) = \phi(p)$, and $(\phi \circ \sigma_1)' = (\phi \circ \sigma_2)'$ by equivalence. ▨

2.1.4 Isomorphism with Euclidean Spaces

> **Definition 2.8** ("Straight Lines").
> Choose a coordinate chart $\phi \in \Phi$ atlas near p. For all $v \in \mathbb{R}^m$, we define
>
> $$\gamma_v^\phi(t) := \phi^{-1}(\phi(p) + tv).$$
>
> In simple words, it is such a curve on manifold that it is a straight line on maps.

Theorem 2.3 (Isomorphism with Straight Lines).

Let $p \in \mathcal{M}$, $p \in \phi \in \Phi$. For any curve γ passing through p, $\exists!\ v \in \mathbb{R}^m$ s.t. γ is tangent to γ_v^ϕ, where v can be explicitly given by $(\phi \circ \gamma)'(0)$.

In other words, the map

$$\ell_p^\phi : \mathbb{R}^m \to T_p\mathcal{M}$$
$$v \mapsto [\gamma_v^\phi]$$

is a bijection with inverse

$$(\ell_p^\phi)^{-1} : T_p\mathcal{M} \to \mathbb{R}^m$$
$$[\gamma] \mapsto (\phi \circ \gamma)'(0).$$

Proof. It is almost by definition that γ is tangent to $(\phi \circ \gamma)'(0)$.

Suppose v_1, v_2 satisfies γ is tangent to $\gamma_{v_1}^\phi, \gamma_{v_2}^\phi$. Then they are tangent too. So

$$(\phi \circ \gamma_{v_1}^\phi)'(0) = (\phi \circ \gamma_{v_2}^\phi)'(0).$$

Therefore, $v_1 = v_2$. ▨

⤴ **Remark.**

A natural question is that whether two charts behave "the same" if $U_1 \cap U_2 \neq \varnothing$. Under this perspective, the criterion is clear: we need only to check whether a straight line is still a straight line in another chart, which is true indeed. It also produces the coordinate transformation formula for free. See below. ♏

Theorem 2.4 (Coordinate Transformation of Straight Lines).

Choose $\phi, \psi \in \Phi$, $\phi : U_1 \to \mathbb{R}^m$, $\psi : U_2 \to \mathbb{R}^m$ s.t. $U_1 \cap U_2 \neq \varnothing$ and $p \in U_1 \cap U_2$. Let the corresponding straight line isomorphisms ℓ_p^ϕ, ℓ_p^ψ. Then $(\ell_p^\psi)^{-1} \circ \ell_p^\phi$ is a linear isomorphism.

Let the local coordinates induced by ϕ be $x^1, \dots, x^m$, ψ be $y^1, \dots, y^m$, then $(\ell_p^\psi)^{-1} \circ \ell_p^\phi$ can be expressed in terms of Jacobian, namely,

$$(\ell_p^\psi)^{-1} \circ \ell_p^\phi(v) = J_{\psi \circ \phi^{-1}}(\phi(p))v.$$

Proof.

$$(\ell_p^\psi)^{-1} \circ \ell_p^\phi(v) = (\ell_p^\psi)^{-1}(\phi^{-1}(\phi(p) + vt))$$
$$= ((\psi \circ \phi^{-1})(\phi(p) + vt))'(0)$$
$$= J_{\psi \circ \phi^{-1}}(\phi(p))v$$

▨

Definition 2.9 (Alternative Definition for Addition).

For $v_1, v_2 \in T_p\mathcal{M}$, we define addition via the isomorphism Theorem 2.3,

$$v_1 + v_2 := (\ell_p^\phi)^{-1}(\ell_p^\phi(v_1) + \ell_p^\phi(v_2)).$$

Definition 2.10 (Alternative Definition of Basis Tangent Vectors).

$$\left(\partial_\mu\right)_p := \ell_p^\phi(e^\mu).$$

2.2 The Algebraic Formulation of Tangent Spaces

2.2.1 The Space of Derivations

Definition 2.11 (Derivation).

A derivation at $p \in \mathcal{M}$ is a map $v : C^\infty(\mathcal{M}) \to \mathbb{R}$ s.t.

1. $v(rf + g) = rv(f) + v(g)$, (Linear)

2. $v(fg) = f(p)v(g) + g(p)v(f)$, (Leibniz)

where $f, g \in C^\infty$.

Definition 2.12 (Tangent Space (Algebraic)).

The space of all derivations at $p \in \mathcal{M}$ is denoted $D_p\mathcal{M}$.

Definition 2.13 (Addition and Scalar Multiplication).
Given $v_1, v_2 \in D_p\mathcal{M}$, define

$$(v_1 + v_2)(f) := v_1(f) + v_2(f)$$
$$(rv)(f) := rv(f).$$

Theorem 2.5.
$D_p\mathcal{M}$ is a real vector space.

2.2.2 The Basis Tangent Vectors

Definition 2.14 (Basis Tangent Vectors).
We define the basis tangent vectors via derivations by

$$\left(\partial_\mu\right)_p f := \frac{\partial}{\partial u^\mu}(f \circ \phi^{-1}(\vec{u}))\bigg|_{\vec{u}=\phi(p)}, 1 \le \mu \le \dim \mathcal{M}.$$

where $u \in \mathbb{R}^m, f : \mathcal{M} \to \mathbb{R}, f \in C^\infty$. For the use of u^μ, see Definition 1.5.

Theorem 2.6.

$$\left(\partial_\mu\right)_p x^\nu = \delta^\nu{}_\mu.$$

Proof. Although a simple exercise, it was a good chance to explain the sophisticated notation.

$$\left(\partial_\mu\right)_p x^\mu = \frac{\partial}{\partial u^\mu}\left(x^\mu \circ \phi^{-1}\begin{pmatrix} u^1 \\ \vdots \\ u^m \end{pmatrix}\right)\bigg|_{\phi(p)}.$$

The coordinate $u \in \mathbb{R}^m$ was brought to $\mathcal{M}$ and projected to $\mathbb{R}^m$ again and taken out the μ-th component. So

$$= \frac{\partial}{\partial u^\mu}(u^\mu)\bigg|_{\phi(p)} = 1.$$

Theorem 2.7 (Linear Independence of Basis Tangent Vectors)**.**
The basis tangent vectors $\left(\partial_\mu\right)_p, 1 \leq \mu \leq \dim \mathcal{M}$ are linear independent.

Proof. Suppose $a^\mu \left(\partial_\mu\right)_p = 0$. Then

$$a^\mu \left(\partial_\mu\right)_p (x^\nu) = a^\mu \delta^\nu{}_\mu = 0(x^\nu) = 0.$$

So $a^\mu = 0$. ▨

Theorem 2.8 (Coordinate Expansion of Tangent Vectors)**.**
For all $v \in D_p\mathcal{M}$, we have
$$v = v^\mu \left(\partial_\mu\right)_p,$$
where Einstein notation was used, and $v^\mu = v(x^\mu)$.

↗ **Remark.**
The proof was sophisticated and did not teach me much.

♍

2.3 Isomorphism of Curves and Derivations

Theorem 2.9 (Isomorphism of Curves and Derivations)**.**
Similar to Definition 2.7, we define the linear map $\iota : T_p\mathcal{M} \to D_p\mathcal{M}$ acting on $v = [\sigma] \in T_p\mathcal{M}$ by
$$\iota(v)(f) := \frac{d}{dt}(f \circ \sigma(t))\Big|_{t=0}.$$
Then ι is a linear isomorphism. Note that RHS $\in D_p\mathcal{M}$.

Proof. (linearity) Choose ϕ s.t. $\phi(p) = 0$.

$$
\begin{aligned}
\iota(rv_1 + v_2)(f) &= \frac{d}{dt}(f \circ \phi^{-1} \circ (r\phi \circ \sigma_1 + \phi \circ \sigma_2))\Big|_{t=0} \\
&= ((f \circ \phi^{-1})' \circ (r\phi \circ \sigma_1 + \phi \circ \sigma_2) \cdot (r\phi \circ \sigma_1 + \phi \circ \sigma_2)')\big|_{t=0} \\
&= ((f \circ \phi^{-1})'(0) \cdot ((r\phi \circ \sigma_1)' + (\phi \circ \sigma_2)'))\big|_{t=0} \\
&= (r(f \circ \phi^{-1})' \circ (\phi \circ \sigma_1) \cdot (\phi \circ \sigma_1)' + (f \circ \phi^{-1})' \circ (\phi \circ \sigma_2) \cdot (\phi \circ \sigma_2)')\big|_{t=0} \\
&= r\iota(v_1) + \iota(v_2)(f).
\end{aligned}
$$

(surjectivity) To show surjectivity, we need to construct a curve for all $v' \in D_p\mathcal{M}$ s.t. $\iota(v) = v'$.

Let $v' \in D_p\mathcal{M}$ and construct $\sigma : (-\epsilon, \epsilon) \to \mathcal{M}$ s.t.

$$
\sigma(0) = p,
$$
$$
v^\mu = v(x^\mu) = \frac{d}{dt}(x^\mu \circ \sigma(t))\Big|_{t=0}.
$$

Then
$$
v(f) = v^\mu \left(\partial_\mu\right)_p f = \frac{d}{dt}(x^\mu \circ \sigma(t))\Big|_{t=0} \left(\partial_\mu\right)_p f.
$$

Also,

$$
\begin{aligned}
\frac{d}{dt}(f \circ \sigma(t))\Big|_{t=0} &= \frac{d}{dt}(f \circ \phi^{-1} \circ \phi \circ \sigma(t))\Big|_{t=0} \\
&= \sum_{\mu=1}^{m} \frac{\partial}{\partial u^\mu}(f \circ \phi^{-1})\Big|_{\phi(p)} \frac{d}{dt}(u^\mu \circ \phi \circ \sigma)\Big|_{t=0} \quad \text{(component-wise)} \\
&= \sum_{\mu=1}^{m} \left(\partial_\mu\right)_p f \, \frac{d}{dt}(x^\mu \circ \sigma)\Big|_{t=0} \\
&= v(f).
\end{aligned}
$$

Thus completing the proof. $\qquad\blacksquare$

> ↗ **Remark.**
> It's tempting to use the powerful theorem that surjectivity of linear transformations is equivalent to injectivity. However, the requirement of that theorem is that **the dimensions of the two spaces are equal**. At this point, we don't know the dimension of $T_p\mathcal{M}$, so we cannot do this. ♍

2.4 Pushforward

2.4.1 Definition and Linearity

> ⤴ **Remark.**
> The pushforward $h_* : T_p\mathcal{M} \to T_{h(p)}\mathcal{N}$ of a specific function $h : \mathcal{M} \to \mathcal{N}$ can be thought of as local linearization of the function.
>
> ♍

> **Definition 2.15** (Pushforward).
> Given a function $h : \mathcal{M} \to \mathcal{N}$ and $v \in T_p\mathcal{M}$, then we define the pushforward $h_* : T_p\mathcal{M} \to T_{h(p)}\mathcal{N}$ by
> $$h_*(v) := [h \circ \sigma], \ v = [\sigma].$$

> **Theorem 2.10.**
> The pushforward operation Definition 2.15 is well-defined. That is, $h_*(v_1) = h_*(v_2)$ if $v_1 = [\sigma_1] = [\sigma_2] = v_2$.

> **Theorem 2.11** (Algebraic Definition of Pushforward).
> The definition of pushforward Definition 2.15 is equivalent to the following: let $h : \mathcal{M} \to \mathcal{N}$, $h_* : D_p\mathcal{M} \to D_{h(p)}\mathcal{M}$ is defined by,
> $$(h_*v)(f) := v(f \circ h).$$

Proof. $(\rightarrow)$
$$h_*(v)(f) = [h \circ \sigma](f) = \frac{d}{dt}(f \circ h \circ \sigma(t))\Big|_{t=0}$$
$$= \frac{d}{dt}((f \circ h) \circ \sigma(t))\Big|_{t=0}$$
$$:= v(f \circ h).$$

$(\leftarrow)$ This direction is similar. ▨

> **Theorem 2.12** (Linearity of Pushforward).
> The pushforward map $h_* : T_p\mathcal{M} \to T_{h(p)}\mathcal{N}$ is linear.
> $$h_*(rv_1 + v_2) = rh_*(v_1) + h_*(v_2).$$

Proof. (Using Definition 2.15) Let $p \in (U, \phi) \subseteq \mathcal{M}$, and $h(p) \in (V, \psi) \subseteq \mathcal{N}$. Choose ϕ s.t. $\phi(p) = 0$. It is obvious that $h_*(rv_1 + v_2)(0) = (rh_*(v_1) + h_*(v_2))(0) = h(p)$.

Consider

$$\frac{d}{dt} \underbrace{(\psi \circ h_*(rv_1 + v_2))}_{\mathbb{R}^n \leftarrow \mathcal{N} \leftarrow \mathbb{R}} \bigg|_{t=0} = \frac{d}{dt} (\underbrace{\psi \circ h \circ (\phi^{-1}}_{\mathbb{R}^n \leftarrow \mathcal{N} \leftarrow \mathcal{M} \leftarrow \mathbb{R}^m} \circ \underbrace{(r\phi \circ \sigma_1 + \phi \circ \sigma_2)}_{\mathbb{R}^m \leftarrow \mathcal{M} \leftarrow \mathbb{R}}))) \bigg|_{t=0}$$

$$= (\psi \circ h \circ \phi^{-1})' \circ (r\phi \circ \sigma_1 + \phi \circ \sigma_2) \cdot (r\phi \circ \sigma_1 + \phi \circ \sigma_2)' \big|_{t=0}$$

$$= (\psi \circ h \circ \phi^{-1})'(0) \cdot ((r\phi \circ \sigma_1)' + (\phi \circ \sigma_2)') \big|_{t=0}.$$

And

$$\frac{d}{dt}(\underbrace{\psi}_{\mathbb{R}^n \leftarrow} \circ \underbrace{(rh_*(v_1) + h_*(v_2))}_{\mathcal{N} \leftarrow \mathbb{R}})) \bigg|_{t=0} = \frac{d}{dt} \underbrace{(r\psi \circ h \circ \sigma_1 + \psi \circ h \circ \sigma_2)}_{\mathbb{R}^n \leftarrow \mathcal{N} \leftarrow \mathcal{M} \leftarrow \mathbb{R}} \bigg|_{t=0}$$

$$= (\underbrace{r\psi \circ h \circ \phi^{-1}}_{\mathbb{R}^n \leftarrow \mathcal{N} \leftarrow \mathcal{M} \leftarrow \mathbb{R}^m} \circ \underbrace{\phi \circ \sigma_1}_{\mathbb{R}^m \leftarrow \mathcal{M} \leftarrow \mathbb{R}} + \psi \circ h \circ \phi^{-1} \circ \phi \circ \sigma_2)' \big|_{t=0}$$

$$= (r(\psi \circ h \circ \phi^{-1})' \circ (\phi \circ \sigma_1) \cdot (\phi \circ \sigma_1)') \big|_{t=0}$$

$$\quad + ((\psi \circ h \circ \phi^{-1})' \circ (\phi \circ \sigma_2) \cdot (\phi \circ \sigma_2)') \big|_{t=0}$$

$$= (\psi \circ h \circ \phi^{-1})'(0) \cdot (r(\phi \circ \sigma_1)' + (\phi \circ \sigma_2)') \big|_{t=0}.$$

So we see the two are equal.

(Using Theorem 2.11)

$$(h_*(rv_1 + v_2))(f) = (rv_1 + v_2)(f \circ h)$$
$$= rv_1(f \circ h) + v_2(f \circ h)$$
$$= r(h_* v_1)f + (h_* v_2)f.$$

(Using straight line isomorphism: Definition 2.9)

$$
\begin{array}{ccc}
T_p\mathcal{M} & \xrightarrow{\;\;h_*\;\;} & T_{h(p)}\mathcal{N} \\
\ell_p^{\phi} \uparrow & & \uparrow \ell_{h(p)}^{\psi} \\
\mathbb{R}^m & \longrightarrow & \mathbb{R}^n
\end{array}
$$

Since ℓ_p^ϕ and $\ell_{h(p)}^\psi$ are linear, to prove h_* is linear, we need only to show $\ell_{h(p)}^\psi \circ h_* \circ \ell_p^\phi$ is linear.

$$\ell_{h(p)}^\psi \circ h_* \circ \ell_p^\phi(v) \tag{1}$$
$$= \ell_{h(p)}^\psi \circ h_*([\phi^{-1}(\phi(p) + tv)]) \tag{2}$$
$$= \ell_{h(p)}^\psi([h \circ \phi^{-1}(\phi(p) + tv)]) \tag{3}$$
$$= (\psi \circ h \circ \phi^{-1}(\phi(p) + tv))'(0) \tag{4}$$
$$= (\psi \circ h \circ \phi^{-1})'(\phi(p))v. \tag{5}$$

$\blacksquare$

Theorem 2.13 (Associativity of Pushforwards).
Given manifolds $\mathcal{M}, \mathcal{N}, \mathcal{P}$ and $h : \mathcal{M} \to \mathcal{N}$, $k : \mathcal{N} \to \mathcal{P}$, then

$$(k \circ h)_* = k_* \circ h_*.$$

2.4.2 Jacobian

Theorem 2.14 (Local Representative of Pushforward).
Let $\dim \mathcal{M} = m$, $\dim \mathcal{N} = n$, $h : \mathcal{M} \to \mathcal{N}$, $\{x^1, \dots, x^m\}$ be the local coordinates of $\mathcal{M}$ around p, and $\{y^1, \dots, y^n\}$ be the local coordinates of $\mathcal{N}$ around $h(p)$. Then

$$h_*v = \sum_{\mu=1}^{m} \sum_{\nu=1}^{n} (\partial_\nu)_{h(p)} \left.\frac{\partial h^\nu}{\partial x^\mu}\right|_p v^\mu,$$

where $J^\nu_{\;\mu} := \left.\frac{\partial h^\nu}{\partial x^\mu}\right|_p := (\partial_\mu)_p (y^\nu \circ h)$ is the Jacobian matrix.

Proof. First expand v in terms of local coordinates and use linearity,

$$h_*v = h_*(v^\mu (\partial_\mu)_p) = v^\mu h_*((\partial_\mu)_p).$$

Expand the result in local coordinates of $\mathcal{N}$,

$$h_*((\partial_\mu)_p) = \left(h_* (\partial_\mu)_p\right)^\nu (\partial_\nu)_{h(p)}.$$

Using

$$\left(h_*\left(\partial_\mu\right)_p\right)^\nu = \left(h_*\left(\partial_\mu\right)_p\right) \circ y^\nu$$
$$= \left(\partial_\mu\right)_p (y^\nu \circ h)$$
$$:= \left(\partial_\mu\right)_p h^\nu.$$

So,

$$h_*\left(\left(\partial_\mu\right)_p\right) = \left(\partial_\mu\right)_p h^\nu \left(\partial_\nu\right)_{h(p)}.$$

And,

$$h_* v = v^\mu \left(\partial_\mu\right)_p h^\nu \left(\partial_\nu\right)_{h(p)}.$$

$\blacksquare$

Theorem 2.15 (Using Curve to Pushforward).
Given $c : (-\epsilon, \epsilon) \to \mathcal{M}$ a curve, and choose the coordinate chart of $\mathbb{R}$ to be the identity, then

$$c_*\left(\frac{d}{dt}\right)_0 = [c] \in T_p\mathcal{M}.$$

Proof. First we clarify what is $\left(\frac{d}{dt}\right)_0$. Since on the trivial manifold $\mathbb{R}$ there is only one coordinate, namely t, we need not specify the number. Also, considering our functions are scalar valued $f : \mathcal{M} \to \mathbb{R}$, this motivates us to write "total differential".

For all $f \in C^\infty$,

$$c_*\left(\frac{d}{dt}\right)_0 f = \left(\frac{d}{dt}\right)_0 (f \circ c).$$

Since the coordinate chart is the identity,

$$\left(\frac{d}{dt}\right)_0 (f \circ c) = \frac{d}{dt}(f \circ c \circ I)\Big|_{I(t)=0}$$
$$= \frac{d}{dt}(f \circ c)\Big|_{t=0}$$
$$= [c]f.$$

$\blacksquare$

Theorem 2.16 (Contravariancy of Tangent Vectors).

The components of tangent vectors are contravariant, i.e., given two coordinate charts (U, ϕ) and (U', ϕ') s.t. $U \cap U' = S \neq \varnothing$, then on S,

$$v'^{\nu} = \sum_{\mu=1}^{m} v^{\mu} \frac{\partial x'^{\nu}}{\partial x^{\mu}}.$$

Proof. Given that we have the local representative of pushforward at hand, consider the identity pushforward $\mathrm{id}_* : T_p\mathcal{M} \to T_p\mathcal{M}$,

$$\mathrm{id}_* v = \sum_{\mu=1}^{m} \sum_{\nu=1}^{m} v^{\mu} \left. \frac{\partial x'^{\nu}}{\partial x^{\mu}} \right|_p (\partial_{\nu'})_p.$$

We see immediately that the result holds. ▨

3 Vector Fields

3.1 Definition

Definition 3.1 (Vector Fields)**.**
A vector field X on $\mathcal{M}$ is a smooth assignment of a tangent vector $X_p \in T_p\mathcal{M} \ \forall p \in \mathcal{M}$.

"Smooth" assignment is defined to be that the Lie derivative Definition 3.2 is smooth.

Definition 3.2 (Lie Derivative)**.**
The Lie-derivative of function f with respect to vector field X is defined as

$$\mathcal{L}_X f := Xf,$$

and at a specific point $p \in \mathcal{M}$,

$$\mathcal{L}_X f(p) := Xf(p) := X_p f.$$

Theorem 3.1 (Properties of Lie Derivative)**.**
The Lie derivative has the following properties,

1. $X(rf + g) = rXf + Xg$

2. $X(fg) = fXg + gXf.$

Theorem 3.2 (Component of Vector Field)**.**
Given a chart (U, ϕ) on $\mathcal{M}$, we can write

$$X_U = X_U x^\mu \partial_\mu.$$

When the context is clear or **for convenience**, we write

$$X = X x^\mu \partial_\mu := X^\mu \partial_\mu.$$

Proof. We know

$$(Xf)(p) = X_p f = X_p x^\mu \left(\partial_\mu\right)_p f = (Xx^\mu)(p)\left(\partial_\mu\right)_p f.$$

▨

> ↗ **Remark.**
> ∂_μ is a vector field that assigns each point $p \in \mathcal{M}$ with the vector $\left(\partial_\mu\right)_p \in T_p\mathcal{M}$.
>
> ♏

Theorem 3.3 (Contravariancy of Vector Fields)**.**
Given two coordinate charts (U, ϕ) and (U', ϕ') s.t. $U \cap U' = S \neq \varnothing$. On S,

$$X^{\nu'} = \sum_{\mu=1}^{m} X^\mu \frac{\partial x'^\nu}{\partial x^\mu}.$$

Analogous to Theorem 2.16.

3.2 Lie Bracket

Definition 3.3 (Composition of Vector Fields)**.**
We can view $X : C^\infty(\mathcal{M}) \to C^\infty(\mathcal{M})$, and so does Y. Therefore, we define

$$(X \circ Y)(f) := X(Yf).$$

Definition 3.4 (Lie Bracket (Commutator))**.**
We define the Lie Bracket of two vector fields X, Y to be

$$[X, Y] := X \circ Y - Y \circ X.$$

In particular,

$$[X, Y](f) = \mathcal{L}_X(\mathcal{L}_Y f) - \mathcal{L}_Y(\mathcal{L}_X f)$$

Lie Bracket Definition 3.4 is a vector field, while the expression $X \circ Y$ is not, because it contains second differential terms. See the following proof.

♍

Theorem 3.4 (Lie Bracket Components)**.**

$$[X,Y]^\mu = (X^\nu \partial_\nu Y^\mu - Y^\nu \partial_\nu X^\mu).$$

Proof. Given $X = X^\mu \partial_\mu, Y = Y^\nu \partial_\nu$, we try to write the component of $X \circ Y$.

$$X \circ Y(f) = X^\mu \partial_\mu \left(Y^\nu \partial_\nu f \right).$$

However, notice that

$$Y^\nu := Y x^\nu \in C^\infty(\mathcal{M});$$
$$\partial_\nu : C^\infty(\mathcal{M}) \to C^\infty(\mathcal{M}),$$
$$\implies \partial_\nu f \in C^\infty(\mathcal{M}).$$

So we need to use the Leibniz property of ∂_μ Definition 2.11 in order to evaluate the second term. Doing this for $X \circ Y(f)$ and $Y \circ X(f)$, we have

$$X \circ Y(f) = X^\mu \left((\partial_\mu Y^\nu)(\partial_\nu f) + Y^\nu \partial_\mu \partial_\nu f \right).$$
$$Y \circ X(f) = Y^\nu \left((\partial_\nu X^\mu)(\partial_\mu f) + X^\mu \partial_\nu \partial_\mu f \right).$$

So if $\partial_\mu \partial_\nu f = \partial_\nu \partial_\mu f$, then by subtracting, we can cancel the second order terms, and we are done. We prove so now.

$$
\begin{aligned}
(\partial_\mu \partial_\nu f)(p) &= \frac{\partial}{\partial u^\mu} \left((\partial_\nu f) \circ \phi^{-1} \right)\big|_{\phi(p)} \\
&= \frac{\partial}{\partial u^\mu} \left((\partial_\nu)_{\phi^{-1}(u)} f \right)\big|_{\phi(p)} \\
&= \frac{\partial}{\partial u^\mu} \left(\frac{\partial}{\partial u^\nu}(f \circ \phi^{-1})\big|_u \right)\Big|_{\phi(p)} \\
&= \frac{\partial}{\partial u^\nu} \left(\frac{\partial}{\partial u^\mu}(f \circ \phi^{-1})\big|_u \right)\Big|_{\phi(p)} \\
&= (\partial_\nu \partial_\mu f)(p).
\end{aligned}
$$

▨

Theorem 3.5 (Properties of Lie Brackets)**.**

1. $[X, Y] = -[Y, X]$ (antisymmetry)

2. $\sum_{\text{cyc}}[X, [Y, Z]] = 0.$ (Jacobi Identity)

3.3 Integral Curves and Flows

Definition 3.5 (Intergral Curve)**.**
Let X be a vector field on $\mathcal{M}$, $p \in \mathcal{M}$. Then an integral curve of X through p is a curve $\sigma : (-\epsilon, \epsilon) \to \mathcal{M}$ s.t.

$$\sigma(0) = p,$$
$$\sigma_* \left(\frac{d}{dt} \right)_t = X_{\sigma(t)}.$$

↗ **Remark.**
Qualitatively, using Theorem 2.15, this pushforward is just $[\sigma] \in T_{\sigma(t)}\mathcal{M}$. Therefore, the second condition is saying in some sense that the curve is tangent to the vector field on the manifold. For quantitative description, see below.

♍

Definition 3.6 (Differential Equations of Integral Curve)**.**
The components X^μ of X determine the integral curve σ by the following ODE with boundary conditions,

$$X^\mu(\sigma(t)) = \frac{d}{dt} x^\mu(\sigma(t))$$
$$x^\mu(\sigma(0)) = x^\mu(p), \mu = 1, 2, \ldots, m.$$

3.3.1 One-parameter Family of Diffeomorphisms

Definition 3.7 (Local 1D Family of Local Diffeomorphisms).
A local, 1D family of local diffeomorphisms at $p \in \mathcal{M}$ is made up of (1) an open neighborhood U of p, (2) $\epsilon > 0$ (3) a family of diffeomorphisms $\{\, \phi_t \mid |t| < \epsilon \,\}$, $\phi_t : U \to \mathcal{M}$ s.t.

1. Every ϕ_t is a smooth function in t and q.

2. $\forall t, s \in \mathbb{R}$ and $|t|, |s|, |t+s| < \epsilon$, and $\forall q \in U$ s.t. $\phi_t(q), \phi_s(q), \phi_{t+s}(q) \in U$, we have
$$\phi_s(\phi_t(q)) = \phi_{s+t}(q).$$

3. $\phi_0(q) = q$.

⚲ Remark.
The first "local" refers to the parameter t, which is limited to $(-\epsilon, \epsilon)$. The second "local" refers to the spatial limitation to U. You can view $\phi_t(q)$ as a curve that brings $t \in (-\epsilon, \epsilon)$ to $\phi_t(q) \in \mathcal{M}$.

♏

Definition 3.8 (Induced Vector Field).
By taking tangents to the curve family Definition 3.7, we have the induced vector field X^ϕ given by

$$X_q^\phi(f) := \left.\frac{d}{dt}(f(\phi_t(q)))\right|_{t=0}$$

Theorem 3.6.
The curve family $t \mapsto \phi_t(q)$ is the integral curve of the induced vector field Definition 3.8 X_q^ϕ.

Proof.

$$X^\phi_{\phi_s(q)} = \frac{d}{dt}(f \circ \phi_t \circ \phi_s(q))\Big|_{t=0}$$
$$= \frac{d}{dt}(f \circ \phi_{t+s}(q))\Big|_{t=0}.$$

Let $u = t + s$. Then

$$X^\phi_{\phi_s(q)} = \frac{d}{du}(f \circ \phi_u(q))\Big|_{u=s}.$$
$$= \phi_{q*}\left(\frac{d}{dt}\right)_s f.$$

3.3.2 Local Flows

Definition 3.9 (Local Flow).
Let X be a vector field on open $U \subseteq \mathcal{M}$, and $p \in U$. A local flow at p is a local one-parameter family of local diffeomorphisms Definition 3.7 defined on some open $V \subseteq U$ s.t. $p \in V$ and the induced vector field Definition 3.8 is X.

⤢ **Remark.**
Local flows always exist and are unique. In contrast, global flows (which means $t \in \mathbb{R}$ instead of a restricted interval) may not exist.

♍

3.3.3 Lie Derivative

Theorem 3.7 (Interpretation of Lie Bracket).
If X, Y are two vector fields on $\mathcal{M}$, and define the following quantity, which can be interpreted as the change of Y when following the integral curves of X, as

$$\frac{d}{dt}(\phi^X_{-t*}(Y))\Big|_{t=0} := \lim_{\epsilon \to 0} \frac{\phi^X_{-\epsilon*}(Y_{\phi^X_\epsilon(p)}) - Y_p}{\epsilon}.$$

Then,

$$\frac{d}{dt}(\phi^X_{-t*}(Y))\Big|_{t=0} = [X, Y].$$

26

4 Cotangent Spaces

4.1 Cotangent Vectors

Definition 4.1 (Cotangent Spaces).
The cotangent space $T_p^*\mathcal{M}$ at $p \in \mathcal{M}$ is the set of all linear functions $f : T_p\mathcal{M} \to \mathbb{R}$.
Its member is called a cotangent vector.
$\dim T_p^*\mathcal{M} = \dim T_p\mathcal{M}$.

Definition 4.2 (One-Form).
A one-form on $\mathcal{M}$ is a smooth assignment of cotangent vectors $\omega : p \mapsto \omega_p$.
It may be understood as a covector field.

Definition 4.3 (Basis Cotangent Vectors).
The basis cotangent vectors is chosen to be the dual basis of the basis tangent vectors Definition 2.14,
$$(dx^\mu)_p((\partial_\nu)_p) = \delta^\mu{}_\nu.$$

Theorem 4.1 (Coordinate Expression of Cotangent Vectors).
Any $f \in T_p^*\mathcal{M}$ can be expanded as

$$f = f_\mu (dx^\mu)_p.$$

Any one-form ω can be expressed as

$$\omega = \omega_\mu dx^\mu.$$

4.2 Pullback

4.2.1 Definition

> **Definition 4.4** (Pullback).
>
> Given a function and its pushforward, we define pullback to be the dual of pushforward, i.e.,
>
> $$
> \begin{aligned}
> h &: & \mathcal{M} &\to & \mathcal{N}, \\
> h_* &: & T_p\mathcal{M} &\to & T_{h(p)}\mathcal{N}, \\
> h^* &: & T^*_{h(p)}\mathcal{N} &\to & T^*_p\mathcal{M},
> \end{aligned}
> $$
>
> s.t. given $f \in T^*_{h(p)}\mathcal{N}$ and $v \in T_p\mathcal{M}$,
>
> $$(h^*f)(v) := f(h_*v).$$

> ↗ **Remark.**
>
> Note especially on the direction of original function and its induced pullback. This is crucial to the covariancy of one-forms.   ♏

> **Theorem 4.2.**
>
> Given ω a one-form on $\mathcal{N}$, and a function $h : \mathcal{M} \to \mathcal{N}$, the pullback $h^*\omega$ is defined as
> $$(h^*\omega)(v)_p = \omega(h_*v)_{h(p)}.$$

> **Theorem 4.3** (Associativity of Pullbacks).
>
> Analogous to Theorem 2.13, given manifolds $\mathcal{M}, \mathcal{N}, \mathcal{P}$ and $h : \mathcal{M} \to \mathcal{N}$, $k : \mathcal{N} \to \mathcal{P}$, then
> $$(k \circ h)^* = k^* \circ h^*.$$

4.2.2 Jacobian

> **Theorem 4.4** (Local Representative of Pullback).
>
> Let $\dim \mathcal{M} = m, \dim \mathcal{N} = n, h : \mathcal{M} \to \mathcal{N}, \{x^1, \dots, x^m\}$ be the local coordinates of $\mathcal{M}$ around p, and $\{y^1, \dots, y^n\}$ be the local coordinates of $\mathcal{N}$ around $h(p)$. Then
>
> $$h^*\omega = \sum_{\mu=1}^{m}\sum_{\nu=1}^{n} \omega_\nu \left.\frac{\partial h^\nu}{\partial x^\mu}\right|_p (dx^\mu)_p,$$
>
> where $J^\nu{}_\mu := \left.\frac{\partial h^\nu}{\partial x^\mu}\right|_p := \left(\partial_\mu\right)_p (y^\nu \circ h)$ is the Jacobian matrix.

Proof. We know by Definition 4.4,

$$(h^*\omega)_\mu(p) = h^*\omega(\partial_\mu) = \omega(h_*\partial_\mu).$$

Expand it in local coordinates of $\mathcal{N}$,

$$(h^*\omega)_\mu(p) = \omega_\nu dy^\nu(h_*\partial_\mu).$$

Via similar procedure in Theorem 2.14, we arrive at

$$(h^*\omega)_\mu(p) = \omega_\nu \frac{\partial h^\nu}{\partial x^\mu}.$$

4.3 Transformation Properties

Theorem 4.5 (Covariancy and Contravariancy).
Given two coordinate charts (U, ϕ) and (U', ϕ') s.t. $U \cap U' = S \neq \varnothing$, then on S,

$$X^{\nu'} = \sum_{\mu=1}^{m} \frac{\partial x'^{\nu}}{\partial x^{\mu}} X^{\mu},$$

$$\omega_{\nu'} = \sum_{\mu=1}^{m} \omega_{\mu} \frac{\partial x^{\mu}}{\partial x'^{\nu}}.$$

If Jacobian matrix is given,

$$J^{\nu'}{}_{\mu} := \left. \frac{\partial x'^{\nu}}{\partial x^{\mu}} \right|_{p} := \left(\partial_{\mu} \right)_{p} x'^{\nu},$$

$$(J^{-1})^{\mu}{}_{\nu'} := \left. \frac{\partial x^{\mu}}{\partial x'^{\nu}} \right|_{p} := \left(\partial_{\nu'} \right)_{p} x^{\mu},$$

then,

$$X^{\nu'} = J^{\nu'}{}_{\mu} X^{\mu}, \qquad\qquad \text{(contravariant)}$$

$$\omega_{\nu'} = \omega_{\mu} (J^{-1})^{\mu}{}_{\nu'}. \qquad\qquad \text{(covariant)}$$

Proof. The contravariant part is proved in Theorem 2.16. Now we turn to the covariant part.

Let $h = \mathrm{id} : (U, \phi) \subseteq \mathcal{M} \to (U', \phi') \subseteq \mathcal{M}$, consider its pullback.

$$(\mathrm{id}^{*} \omega)_{p} = \omega_{\nu'} \frac{\partial x'^{\nu}}{\partial x^{\mu}} dx^{\mu}.$$

Then,

$$\omega_{\mu} = \omega_{\nu'} \frac{\partial x'^{\nu}}{\partial x^{\mu}}.$$

Inverting the matrix equation above, we get the desired result. ▨

5 Tensors

Definition 5.1 (Tensors).

If $\dim \mathcal{M} \neq \infty$, the tensors of type (r, s) $T_p^{r,s}\mathcal{M}$ are all the linear functions

$$f : \overset{r}{\bigtimes} T_p^*\mathcal{M} \times \overset{s}{\bigtimes} T_p\mathcal{M} \to \mathbb{R}.$$

I.e., it eats r covectors and s vectors.

Theorem 5.1 (Dimensions of General Tensor Space).

The dimension of $T_p^{r,s}\mathcal{M}$ is $m^r m^s$. In particular, a basis for the space is,

$$\bigotimes_{1 \leq \mu_1 \cdots \mu_r \leq m} \left(\partial_{\mu_i}\right)_p \otimes \bigotimes_{1 \leq \nu_1 \cdots \nu_s \leq m} \left(dx^{\nu_i}\right)_p$$

↗ **Remark.**

For a detailed proof, see Hoffman.   ♍

6   n-Forms

6.1   Definition

> **Definition 6.1** (n-Forms).
>
> An n-form is a tensor field of type $(0, n)$ that is totally skew-symmetric (or alternating, or totally antisymmetric), i.e.,
>
> $$\omega(X_1, X_2, \ldots, X_n) = (\operatorname{sgn} \sigma)\omega(X_{\sigma(1)}, \ldots, X_{\sigma(n)}), \ \forall \sigma \in S_n.$$
>
> The set of all n-forms on $\mathcal{M}$ is denoted as $\Lambda^n(\mathcal{M})$.
> The set of all forms is $\Lambda(\mathcal{M}) = \bigoplus_{n=0}^{\dim \mathcal{M}} \Lambda^n(\mathcal{M})$.
> Conventionally, we classify functions as 0-forms.

6.2   The Exterior Product

> **Definition 6.2** (Exterior Product).
>
> Given $\omega_1 \in \Lambda^{n_1}(\mathcal{M}), \omega_2 \in \Lambda^{n_2}(\mathcal{M})$, their exterior product is a $(n_1 + n_2)$-form given by,
> $$\omega_1 \wedge \omega_2 := \frac{1}{n_1! n_2!} \sum_{\sigma \in S_{n_1+n_2}} (\operatorname{sgn} \sigma)(\omega_1 \otimes \omega_2)_\sigma.$$
>
> Written explicitly,
>
> $$(\omega_1 \wedge \omega_2)(X_1, \ldots, X_{n_1+n_2}) :=$$
> $$\frac{1}{n_1! n_2!} \sum_{\sigma \in S_{n_1+n_2}} (\operatorname{sgn} \sigma)(\omega_1 \otimes \omega_2)(X_{\sigma(1)}, \ldots, X_{\sigma(n_1+n_2)})$$

> 🖉 **Remark.**
>
> I'll take the alternating property and associativity of the exterior product for granted. For a detailed proof, see Hoffman.   ♍

Theorem 6.1 (Commutativity with Pullback).
Given $h : \mathcal{M} \to \mathcal{N}$ and $\alpha, \beta \in \Lambda(\mathcal{N})$, then

$$h^*(\alpha \wedge \beta) = (h^*\alpha) \wedge (h^*\beta).$$

↗ **Remark.**
For a "generalized" pullback, we have,

$$(h^*(\alpha))(X_1, \ldots, X_{n_1}) = \alpha(h_*X_1, \ldots, h_*X_{n_1}).$$

♍

Proof.

$$(h^*\alpha) \wedge (h^*\beta)$$

$$= \frac{1}{n_1!n_2!} \sum_{\sigma \in S_{n_1+n_2}} (\operatorname{sgn}\sigma)\alpha \otimes \beta(h_*X_{\sigma(1)}, \ldots, h_*X_{\sigma(n_1+n_2)}).$$

$$= \frac{1}{n_1!n_2!} \sum_{\sigma \in S_{n_1+n_2}} (\operatorname{sgn}\sigma)h^*\left(\alpha \otimes \beta(X_{\sigma(1)}, \ldots, X_{\sigma(n_1+n_2)})\right).$$

$$= h^*\left(\frac{1}{n_1!n_2!} \sum_{\sigma \in S_{n_1+n_2}} (\operatorname{sgn}\sigma)\alpha \otimes \beta(X_{\sigma(1)}, \ldots, X_{\sigma(n_1+n_2)})\right).$$

$$= h^*(\alpha \wedge \beta).$$

▨

Theorem 6.2 (Skew-Symmetry).
The exterior product makes $\Lambda(\mathcal{M})$ a graded algebra with skew-symmetry given by

$$\omega_1 \wedge \omega_2 = (-1)^{n_1 n_2}\omega_2 \wedge \omega_1.$$

Proof. In the definition of exterior product, first fix $\sigma = \sigma_0$ to consider only one term.

When we switch ω_1 and ω_2, we are essentially doing

$$(\omega_2 \otimes \omega_1)(X_{\sigma_0(1)}, \dots, X_{\sigma_0(n_2)}, \underbrace{X_{\sigma_0(n_2+1)}, \dots, X_{\sigma_0(n_1+n_2)}})$$
$$=(\omega_1 \otimes \omega_2)(\underbrace{X_{\sigma_0(n_2+1)}, \dots, X_{\sigma_0(n_1+n_2)}}, X_{\sigma_0(1)}, \dots, X_{\sigma_0(n_2)}).$$

Now,

$$\underbrace{1, 2, \dots, n_2}, \underbrace{n_2 + 1}, \dots, n_1 + n_2$$

$$\downarrow\ n_2 \text{ times}$$

$$\underbrace{n_2 + 1}, \underbrace{1, 2, \dots, n_2}, \dots, n_1 + n_2$$

$$\downarrow\ (n_1 - 1)n_2 \text{ times}$$

$$\underbrace{n_2 + 1, \dots, n_1 + n_2}, \underbrace{1, 2, \dots, n_2}$$

So $n_1 n_2$ transposes can achieve the desired effect. Therefore, every term in the summation is multiplied by $(-1)^{n_1 n_2}$, and we get the desired result. ▨

Theorem 6.3 (Dimension of n-Forms)**.**
Let $\dim \mathcal{M} = m$. If $1 \leq n \leq m$, then $\Lambda^n(\mathcal{M}) = \binom{m}{n}$. If $n > m$, then $\Lambda^n(\mathcal{M}) = 0$.
Moreover, a basis for $\Lambda^n(\mathcal{M})_p$ is given by,

$$(dx^{\mu_1})_p \wedge (dx^{\mu_2})_p \wedge \cdots \wedge (dx^{\mu_n})_p,\ 1 \leq \mu_1 \leq \cdots \leq \mu_n \leq m.$$

↗ **Remark.**
The proof is quite a pleasure to read (and to think of). Please see Hoffman. ♏

6.3   The Exterior Derivative

Definition 6.3 (Exterior Derivative).
Let ω be an n-form on $\mathcal{M}$, $1 \leq n < \dim \mathcal{M}$. Then the exterior derivative $d\omega$ is a $(n+1)$-form. Let $d\omega(\mathbf{X}) = d\omega(X_1, \dots, X_{n+1})$, then

$$d\omega(\mathbf{X}) := \sum_{i=1}^{n+1} (-1)^{i+1} \mathcal{L}_{X_i}(\omega(\mathbf{X}\backslash\{X_i\}))$$

$$+ \sum_{i<j} (-1)^{i+j} \omega([X_i, X_j], \mathbf{X}\backslash\{X_i, X_j\}).$$

If $\omega \in \Lambda^{\dim \mathcal{M}}(\mathcal{M})$, we define $d\omega = 0$.

Theorem 6.4.
In particular for a 0-form $f \in C^\infty(\mathcal{M})$,

$$df(X) := \mathcal{L}_X f.$$

In coordinates,

$$df = (\partial_\mu f)(dx^\mu).$$

Theorem 6.5.
In particular for a 1-form ω,

$$d\omega(X, Y) = \mathcal{L}_X(\omega(Y)) - \mathcal{L}_Y(\omega(X)) - \omega([X, Y]).$$

Theorem 6.6 (Coordinate Expansion for Exterior Derivative).
In local coordinates, if $\omega = \omega_{\mu_1 \mu_2 \dots \mu_n} dx^{\mu_1} \wedge dx^{\mu_2} \wedge \dots \wedge dx^{\mu_n}$, then

$$d\omega = \partial_\nu \omega_{\mu_1 \mu_2 \dots \mu_n} dx^\nu \wedge dx^{\mu_1} \wedge dx^{\mu_2} \wedge \dots \wedge dx^{\mu_n}$$

Theorem 6.7 (Exterior Derivative and Product).

$$d(\omega_1 \wedge \omega_2) = d\omega_1 \wedge \omega_2 + (-1)^{\deg \omega_1} \omega_1 \wedge d\omega_2.$$

Theorem 6.8 (Exterior Derivative and Pullback).
Given $h : \mathcal{M} \to \mathcal{N}$, ω an n-form on $\mathcal{N}$, then

$$d(h^*\omega) = h^*(d\omega).$$

Theorem 6.9 (Functional Linearity of Exterior Derivative).
Let ω be a 1-form on $\mathcal{M}$. Then $d\omega$ satisfies,

$$d\omega(fX, Y) = fd\omega(X, Y), \ \forall f \in C^\infty(\mathcal{M}),$$

where fX is a vector field that gives $(fX)(p) = f(p)X_p$.

Proof. By Definition 6.3,

$$d\omega(fX, Y) = \mathcal{L}_{fX}(\omega(Y)) - \mathcal{L}_Y(\omega(fX)) - \omega([fX, Y]).$$

We break it down term by term. Firstly,

$$(\mathcal{L}_{fX}(\omega(Y)))(p) = f(p)X_p(\omega(Y)) = f(p)(\mathcal{L}_X(\omega(Y)))(p).$$

So

$$\mathcal{L}_{fX}(\omega(Y)) = f \cdot \mathcal{L}_X(\omega(Y)).$$

Secondly, we tackle $\mathcal{L}_Y(\omega(fX))$. In particular,

$$\omega(fX)(p) = \omega_p(f(p)X_p) = f(p)\omega_p(X_p) = f(p)(\omega(X))(p).$$

Therefore,

$$\mathcal{L}_Y(\omega(fX)) = \mathcal{L}_Y(f \cdot \omega(X)) = (\mathcal{L}_Y f)\omega(X) + f \cdot \mathcal{L}_Y(\omega(X)).$$

Thirdly,

$$\omega([fX, Y]) = \omega((fX) \circ Y - Y \circ (fX)).$$

In particular,

$$((Y \circ (fX))(g))(p) = Y_p((fX)(g)) = Y_p(f \cdot Xg) = (Y_p f)((Xg)(p)) + f(p) \cdot Y_p(Xg).$$

So,

$$Y \circ (fX) = (\mathcal{L}_Y f)X + f \cdot Y \circ X.$$

Substituting back,

$$
\begin{aligned}
\omega([fX, Y]) &= \omega(f \cdot X \circ Y - (\mathcal{L}_Y f)X - f \cdot Y \circ X) \\
&= \omega(f[X, Y] - (\mathcal{L}_Y f)X) \\
&= f\omega([X, Y]) - (\mathcal{L}_Y f)\omega(X).
\end{aligned}
$$

Finally,

$$
\begin{aligned}
d\omega(fX, Y) &= \mathcal{L}_{fX}(\omega(Y)) - \mathcal{L}_Y(\omega(fX)) - \omega([fX, Y]) \\
&= f \cdot \mathcal{L}_X(\omega(Y)) - (\mathcal{L}_Y f)\omega(X) - f \cdot \mathcal{L}_Y(\omega(X)) - f\omega([X, Y]) + (\mathcal{L}_Y f)\omega(X) \\
&= f(\mathcal{L}_X(\omega(Y)) - \mathcal{L}_Y(\omega(X)) - \omega([X, Y])) \\
&= f d\omega(X, Y).
\end{aligned}
$$

∎

> **Corollary 6.9.1** (Local Nature of Exterior Derivative)**.**
> When ω is fixed, the value of $d\omega$ depends only on the local values of vector fields.
> $$d\omega(X, Y)(p) = X^\mu(p)Y^\nu(p)d\omega(\partial_\mu, \partial_\nu)(p).$$

Proof. Write $X = X^\mu \partial_\mu$, noting that $X^\mu \in C^\infty(\mathcal{M})$, and use Theorem 6.9. ∎

6.4 DeRham Cohomology

Theorem 6.10 (Twice Exterior Differential).
For all $\omega \in \Lambda^n(\mathcal{M}), 1 \leq n \leq \dim M$, we have

$$d^2\omega = 0.$$

↗ Remark.
This means

$$\operatorname{Im}(d : \Lambda^{n-1}(\mathcal{M}) \to \Lambda^n(\mathcal{M})) \subseteq \operatorname{Ker}(d : \Lambda^n(\mathcal{M}) \to \Lambda^{n+1}(\mathcal{M})).$$

This type of structure is called a differential complex, and is common in many structures. ♏

Definition 6.4 (Closed Form).
An n-form ω is closed if $d\omega = 0$. The set of all closed n-forms is denoted $Z^n(\mathcal{M})$.

Definition 6.5 (Exact Form).
An n-form ω is exact if $\omega = d\beta$ for some $(n-1)$-form β. The set of all exact n-forms is denoted $B^n(\mathcal{M})$.

↗ Remark.
It is guaranteed that $B^n(\mathcal{M}) \subseteq Z^n(\mathcal{M})$, that is, exactness implies closure. But how much closed form is not exact is the study of cohomology theory. ♏

Theorem 6.11 (Poincare's Lemma).
On Euclidean space $\mathbb{R}^m$,

$$B^n(\mathcal{M}) = Z^n(\mathcal{M}), \ \forall n > 0.$$

> **Definition 6.6** (DeRham Cohomology Groups).
> The DeRham cohomology groups $H^n(\mathcal{M}), 0 \leq n \leq \dim \mathcal{M}$ are the quotient spaces
> $$H^n(\mathcal{M}) := Z^n(\mathcal{M})/B^n(\mathcal{M}).$$

> **↗ Remark.**
> Recall the definition of quotient groups that $H^n(\mathcal{M})$ consists of elements of form $z + B^n(\mathcal{M}), z \in Z^n(\mathcal{M})$.
> If all closed forms are exact, $Z^n(\mathcal{M}) \subseteq B^n(\mathcal{M})$, then $H^n(\mathcal{M}) \cong \{0\}$. ♏

> **Theorem 6.12** (Criterion of Exact ODE).
> On the Euclidean space $\mathbb{R}^2$, given a 1-form $\omega = \omega_1 dx^1 + \omega_2 dx^2$. Then
>
> $$\omega \in B^1(\mathbb{R}^2) \iff \partial_2 \omega_1 = \partial_1 \omega_2.$$

> **↗ Remark.**
> This is an important theorem to me, for it connects the "exactness of differential forms" to the familiar notion of "exactness of differential equations".
> It also provides the first hints that we are actually integrating forms, and that exterior differentiation of a 0-form resembles gradient in usual vector calculus terms. ♏

Proof. Via Poincare lemma Theorem 6.11, on $\mathbb{R}^2$, exactness is equivalent to closure. So we need only to determine the condition that $d\omega = 0$. Using Theorem 6.6,

$$\begin{aligned}
d\omega &= \partial_\nu \omega_{\mu_1} dx^\nu \wedge dx^{\mu_1} \\
&= \partial_2 \omega_1 dx^2 \wedge dx^1 + \partial_1 \omega_2 dx^1 \wedge dx^2 \\
&= (\partial_2 \omega_1 - \partial_1 \omega_2) \, dx^2 \wedge dx^1.
\end{aligned}$$

∎
